

# Compliance Note — EU Baseline & Responsible Gambling

Empire of Gold — instant-loading casino lobby (prefetch & caching prototype) · FEG Innovation Hackathon 2026 · Croatian brand (PSK) track · 9 September 2026

**What it is.** A casino lobby whose service worker warms the shared game bundle in the background, so a game opens from disk instead of the network. Every game boots the same certified bundle, which is served byte-identical and never modified. The prototype has no back end, no payments and no real data.

## EU regulatory baseline

| Area                                               | How this build addresses it                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Required before production                                                                                          |
|----------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| <b>GDPR</b><br>Reg. (EU) 2016/679                  | No real personal data and no back end. The demo account — display name, play-money balance, favourites, recently played — is written only to the player's own browser and is never transmitted. Device signals used for caching (image tier, audio codec support, Save-Data) are read locally and never sent.                                                                                                                                                                                       | DPIA if real profiling is introduced; retention, breach and player-rights processes once accounts are server-side.  |
| <b>ePrivacy</b><br>Dir. 2002/58/EC, Art. 5(3)      | <b>The most relevant instrument here.</b> The product writes to terminal equipment: up to ~56 MB in Cache Storage plus localStorage. Caching assets to run the lobby the player opened is technical storage; pre-caching a game not yet requested is an optimisation, and is treated as needing notice and control rather than assumed exempt. Save-Data and 2G are honoured absolutely — the prefetch does not run. No cookies, no trackers, no third-party requests.                              | Storage notice and an opt-out for the large pre-cache; a documented consent assessment for the non-essential phase. |
| <b>AMLD / AMLR, KYC</b><br>2015/849 · 2024/1624    | Deliberately absent. Sign-in accepts a display name only. "Deposit" increments a counter — no payment method, no funds, no identity, no verification service.                                                                                                                                                                                                                                                                                                                                       | Full KYC before play, ongoing monitoring, source-of-funds and enhanced due diligence.                               |
| <b>eIDAS 2.0</b><br>Reg. 910/2014 · 2024/1183      | Not implemented in the prototype.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Age proof as an attribute claim via the EUDI Wallet pattern ("over 18") rather than full ID disclosure.             |
| <b>EU AI Act</b><br>Reg. (EU) 2024/1689            | No AI or ML in the product. "Recommended for you" is a fixed editorial list, not a model. The behavioural analysis behind the caching threshold ran <b>offline</b> on the provided sample dataset and decides only how many bytes to pre-fetch — it never scores a player and never changes what any player is shown.                                                                                                                                                                               | Re-assess if recommendations become model-driven: transparency, and no exploitation of vulnerabilities.             |
| <b>Accessibility</b><br>EAA 2019/882 · WCAG 2.1 AA | Measured rather than assumed. Every text/background pair in the palette clears AA at normal size — lowest 5.87:1 against a 4.5:1 requirement. All 15 handlers sit on native buttons or links, none on a non-interactive element. Icon-only controls carry aria-labels; toggles expose aria-pressed / aria-expanded; form fields have bound labels; dialogs are native <dialog>, so focus trapping and Escape come from the platform. Decorative game art is alt="" with the title in adjacent text. | Screen-reader pass, visible focus styling, and a reduced-motion path for the promo rotation and jackpot ticker.     |

## Responsible gambling & player protection

- **No dark patterns.** Nothing auto-continues, nothing manufactures urgency or scarcity, no disguised advertising, no interstitial pressure to keep playing. Promotional panels are static, clearly labelled as promotions, and identical for every visitor.
- **No inducements to vulnerable or self-excluded customers.** Bonus content is untargeted because there is no targeting: the build has no segmentation, no player profile and no marketing engine.
- **Engagement devices are disclosed.** The rotating promo banner and the counting jackpot ticker are presentational and non-personalised here. In production both must be suppressed for accounts flagged at-risk or self-excluded.
- **18+ is stated but not enforced.** The interface carries an 18+ notice; there is no age gate and no register check. This is recorded as a gap, not presented as a control.

## Croatia (PSK) national layer

The *Act on Games of Chance* and its *Regulation on Measures for Socially Responsible Organisation of Games of Chance* are binding, not soft law: identity and age verification, and a check against the register of excluded players, are required **before play is allowed**. This prototype implements neither. The production design is a server-side register check on the game route, enforced before the bundle is served — not a checkbox in the interface. Data protection is supervised by AZOP under the Croatian GDPR implementation act.

## Data used

No real player data, no identity documents, no live production feeds or APIs. The behavioural analysis that set the caching threshold used the provided sample event-log dataset with hashed player identifiers, processed locally; none of it ships in the product and none of it is reproduced in the interface. Game artwork was supplied by the operator for titles it carries.

## Known gaps — deliberate, prototype scope

1. No age gate and no self-exclusion register check. 2. No KYC or AML onboarding. 3. Storage notice and opt-out for the large pre-cache not yet presented. 4. No server-side account; nothing persists beyond the player's own browser.
